

QA Test Engineer — Job Description Template

Position: QA Test Engineer

Type: [Full-Time / Contract / Part-Time]

Location: [Remote]

Reports To: [LATAM Lead / DevOPS Manager]

About the Role

We are looking for a QA Test Engineer to join our development team and serve as the human-in-the-loop quality layer for an AI-assisted development workflow. You will validate UX/UI changes that AI coding agents produce, build automated test suites, and help modernize our reporting infrastructure by migrating legacy Access and Excel-based reports to Snowflake-powered cloud PDFs.

This is a hands-on role that sits at the intersection of quality assurance, test automation, and light data engineering. You will work directly with production projects in our dev environment, using AI IDEs and coding agents as productivity tools.

Responsibilities

UX/UI Validation

- Manually review and validate UX/UI changes delivered by AI coding agents before they are promoted to production.
- Evaluate usability, accessibility, visual consistency, and interaction flows that automated tools cannot reliably assess.
- Document and communicate defects clearly with steps to reproduce, screenshots, and expected vs. actual behavior.
- Collaborate with developers to iterate quickly on feedback.

Test Automation

- Design, write, and maintain automated test suites (functional, regression, integration) for web applications.
- Select and work with appropriate frameworks (e.g., Playwright, Cypress, Selenium, or Pytest) based on project needs.

- Integrate automated tests into the CI/CD pipeline so that every code change is validated automatically.

GitHub Actions & CI/CD

- Create and maintain GitHub Actions workflows to run tests on pull requests and merges.
- Ensure test results are visible and actionable directly in GitHub — pass/fail summaries, artifact uploads, and failure notifications.
- Maintain clean branching and code hygiene practices within the repository.

AI Automation Projects

- Use AI coding agents (e.g., Claude, Cursor, GitHub Copilot) and AI-enabled IDEs as primary development tools to build and maintain automation scripts.
- Design and implement automation workflows that integrate AI APIs or agents into existing dev and business processes.
- Identify manual, repetitive tasks across teams and propose AI-assisted automation solutions.
- Test, validate, and iterate on AI-generated code — catching hallucinations, logic errors, and edge cases before they reach production.
- Document AI automation patterns and contribute to team best practices for working with AI tools reliably.

Report Automation (Legacy → Cloud)

- Work with stakeholders to understand existing Access database and Excel-based reports.
- Collaborate with data and engineering teams to migrate report logic to Snowflake queries.
- Build or configure automated pipelines that generate and distribute PDF reports from Snowflake data on a schedule.
- Validate output accuracy against legacy reports during the migration period.

Required Skills

Area	Skills
QA & Testing	Functional testing, UX/UI review, bug tracking, test case documentation
Test Automation	Playwright, Cypress, Selenium, or equivalent; Python or JavaScript test scripting

Area	Skills
CI/CD	GitHub Actions, YAML workflow authoring, PR-gated testing
Data	SQL (intermediate), Snowflake (basic to intermediate), Excel/CSV data handling
AI Tools	Prompt engineering, AI coding agents (Claude, Copilot, Cursor), AI IDE workflows
Tools	Git, GitHub, VS Code or AI IDE (e.g., Cursor, Windsurf), Postman
Reporting	PDF generation tooling (e.g., Puppeteer, WeasyPrint, or cloud equivalents)

Nice to Have

- Experience building automation scripts with or around AI agents (Claude API, OpenAI, LangChain, etc.).
 - Familiarity with legacy Microsoft Access databases and data export formats.
 - Experience with Power BI, Looker, or other BI tools.
 - Basic knowledge of Docker for running test environments.
 - REST API testing experience (Postman, pytest-requests, etc.).
-

What Success Looks Like in 90 Days

- ☐ Caught and documented at least [N] UX/UI regressions introduced by AI-generated code before they reached production.
 - ☐ Automated test suite running on every pull request via GitHub Actions.
 - ☐ At least [N] legacy reports migrated to automated Snowflake-to-PDF pipelines.
 - ☐ Clear test coverage reports available to the team.
 - ☐ At least [N] manual workflows automated using AI tooling.
-

Interview Process

1. Recruiter screen (30 min)
 2. Technical assessment
 3. Technical interview with engineering team (60 min)
 4. Final interview with [Hiring Manager / LATAM Team Lead]
-
